Très employé pour les chutes d'eaux usées, pour les eaux vannes, les eaux pluviales et pour les évacuations des appareils sanitaires, le PVC (polychlorure de vinyle) peut désormais servir dans les conduites d'alimentation d'eau sous pression. Pour l'adduction d'eau froide on continue d'employer les tuyaux en polyéthylène noir tandis que, par ailleurs, des tuyaux en polyéthylène dit réticulé (PER) se généralisent : de couleur bleue, blanche ou rouge, ils sont employés dans les circuits de chauffage (planchers chauffants, alimentation des radiateurs) et - dans les installations hydrocâblées - à l'alimentation des appareils sanitaires.

Dans ce domaine, les systèmes plus élaborés de tubes multicouches (composés d'une couche d'aluminium prise entre deux couches de polyéthylène réticulé) facilitent la mise en oeuvre des installations.

L'ouvrage commence par la présentation d'une installation de plomberie : arrivée d'eau, alimentation des appareils et leur diamètre, évacuations et normes. Chaque matériau est décrit en détail avec ses applications et ses conditions de mise en oeuvre, illustré par de nombreux schémas.
